

Dynamic PROOF clusters with PoD Status report and future plans

What is PoD?

PROOF on Demand (PoD) is a tool-set, which sets up a PROOF cluster on any resource management system.

PoD is NOT a substitution of PROOF!

It is rather a helper tool for PROOF.

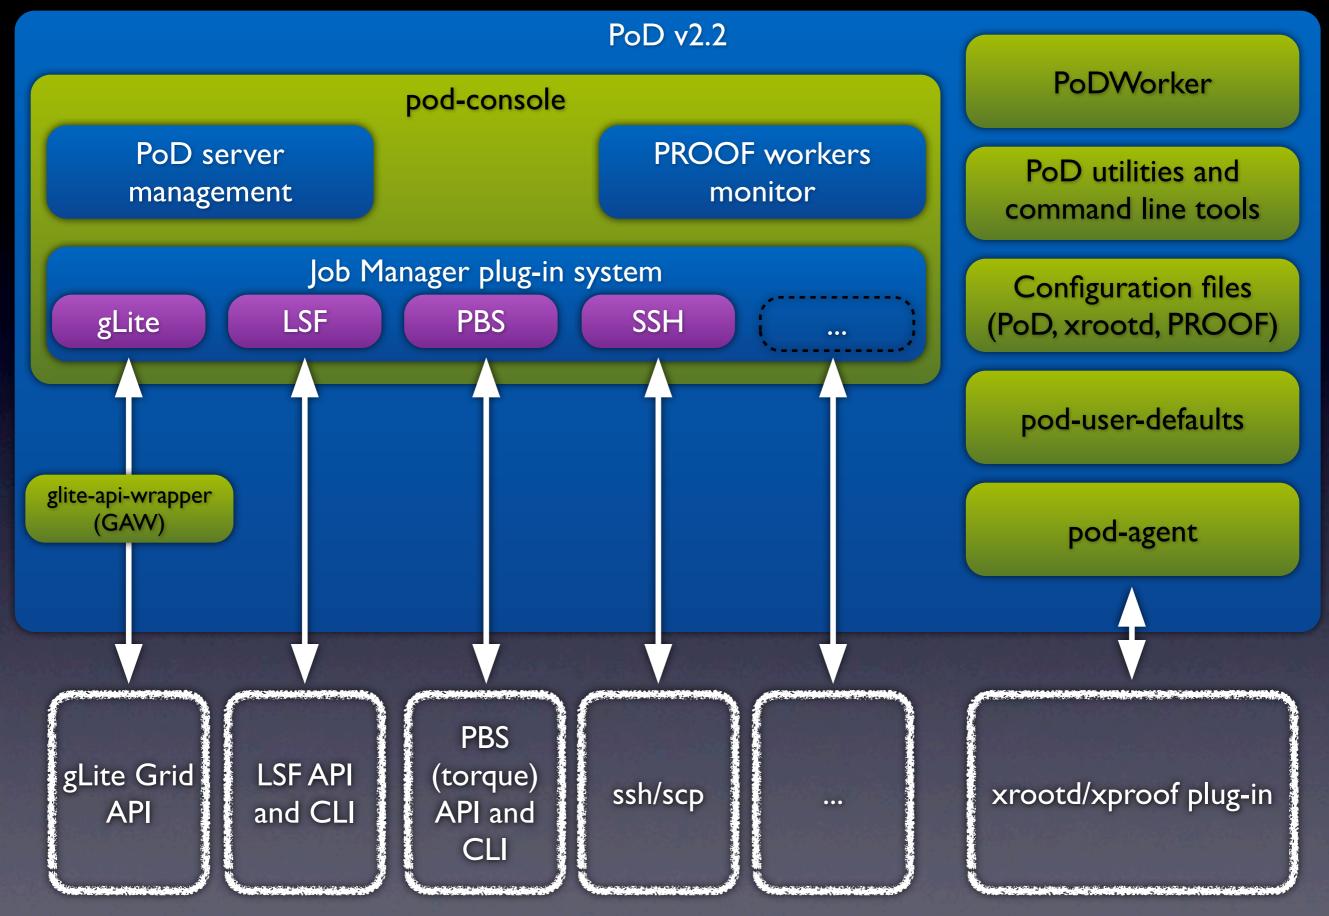

"static"/preinstalled PROOF cluster

- one user can disturb other users,
- from time to time admin. interventions are needed,
- only one ROOT/xrootd version for PROOF services,
- a master node limitation.

PROOF via PoD

User

- can entirely control his/her dynamic cluster,
- can setup and use it on demand,
- can dynamically change an amount of workers,
- can select a preferable master host,
- doesn't need admins to take an action,
- doesn't disturb other users,
- is free to choose a ROOT version for services.

Key features

- Easy to use
- GUI & Command-line
- Different job managers (gLite, LSF, PBS, SSH)
- Multiuser/-core environment
- Native PROOF connections
- Packet-forwarding
- User defaults configuration

Current status

v2.1.4 has been released (2010-05-26)

v2.2 - under development

As the product matures, the support of previous versions is extending...

Improved build-system

- The project has been consolidated and cmake is now the only build system of it.
- A much easier/smarter installation procedure has been released.
- Implemented fully automated builds of releases, nightly and specific binary packages.
- Since years the buildbot serves as a continues integration system.

New version numbers

Old:

maintained manually in VCS and in build config. files. Old schema: "vX.Y.Z" (X - major,Y - minor, Z - patch).

New:

only set a tag ("v.X.Y") in VCS (we use Git) and the rest done automatically, using Git canonical ver. numbers.

"vX.Y" - for a release build

"vX.Y.NN.SSSS" (vX.Y - the latest tag, NN - a number of commits since the tag, and SSSS - object's hash) - for any patch and nightly.

CLI

- pod-server
- pod-info
- pod-submit
- pod-user-defaults
- pod-prep-worker

CLI

- pod-server
- pod-info
- pod-submit
- pod-user-defaults
- pod-prep-worker

Example

- \$ pod-server start (status)
- \$ pod-submit -r lsf -q queue -n 150
- \$ pod-info -n (-l)
- \$ pod-server stop

CLI

- pod-server
- pod-info
- pod-submit
- pod-user-defaults
- pod-prep-worker

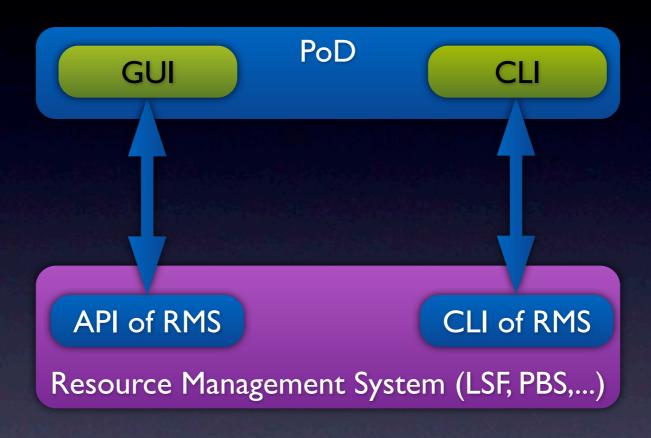

Example

- \$ pod-server start (status)
- \$ pod-submit -r lsf -q queue -n 150
- \$ pod-info -n (-1)
- \$ pod-server stop

can be used in the PROOF script

TProof::Open(gSystem->GetFromPipe("pod-info-c"))

GUI vs CLI

This strategy helps to be more flexible and better integrated into different setups and environments.

gLite plug-in

Updated to support gLite UI 3.2

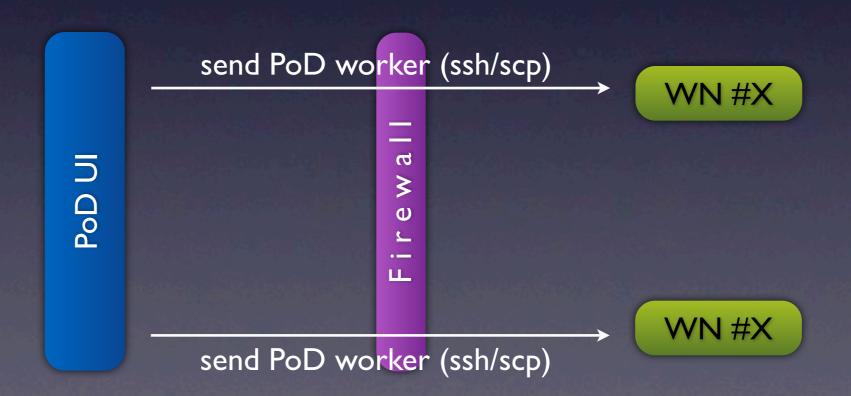

PBS plug-in

Supports

- PBS Pro and Torque,
- shared and not shared file systems.

SSH plug-in

a simple CSV file as an input to the plug-in:

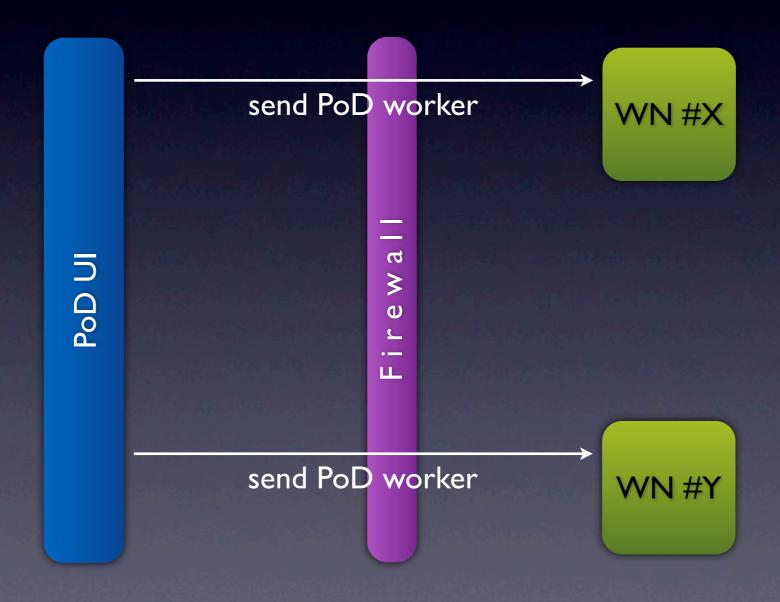

SSH plug-in & tunnel

PoD will optionally create an ssh tunnels for nodes behind a firewall.

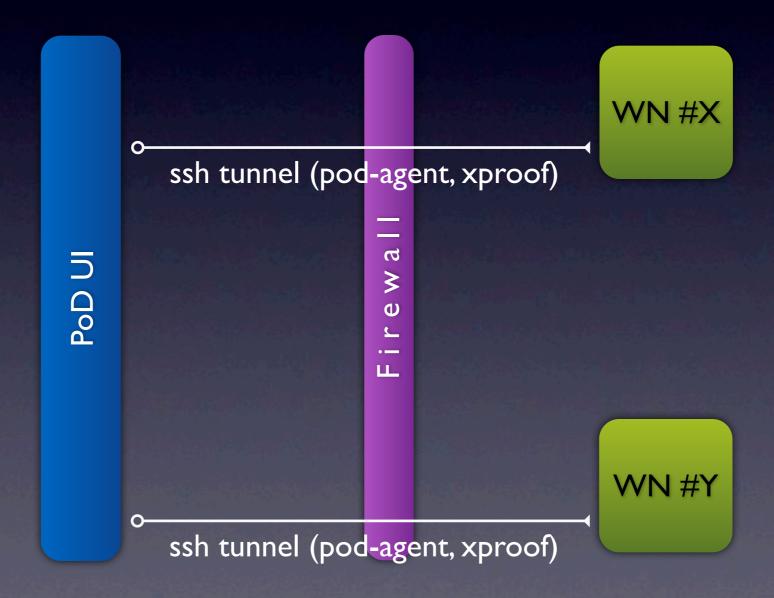

SSH plug-in & tunnel

PoD will optionally create an ssh tunnels for nodes behind a firewall.

SSH plug-in & tunnel

PoD will optionally create an ssh tunnels for nodes behind a firewall.

SSH plug-in & cloud

- Distribute data files,
- prepare an OS image, which includes PoD's worker package (made by pod-prep-worker),
- send the image to a cloud provider, requesting an ssh access to nodes,
- pass the list of workers to PoD ssh plug-in,
- enjoy your cloud based PROOF cluster (can be used privately or by a group)...

ToDo

- "out of server" UI,
- a native Mac OS X implementation of UI,
- an AliEn plug-in,
- a Condor plug-in.
